

LASER WAVELENGTH METER

671 Series

Reliable accuracy gives you greater confidence in your experimental results.

The 671 Series Laser Wavelength Meter from Bristol Instruments uses proven Michelson interferometer-based technology to accurately measure the wavelength of CW lasers that operate from the visible to mid-infrared.

Two versions are available. The model 671A is the most precise, measuring wavelength to an accuracy of ± 0.2 parts per million (± 0.0002 nm at 1000 nm). For experiments that are less exacting, the model 671B is a lower-priced alternative with an accuracy of ± 0.75 parts per million (± 0.0008 nm at 1000 nm).

To guarantee wavelength measurement accuracy, the 671 Laser Wavelength Meter is continuously calibrated with a built-in HeNe laser. This is an ideal reference source because its wavelength is well-known and fixed by fundamental atomic structure. To achieve the highest accuracy, the 671A system uses a single-frequency HeNe laser that is stabilized using a precise balanced longitudinal mode technique. A standard HeNe laser is used as the wavelength reference in the model 671B.
